

PROBLEM STATEMENT:

Write a program that will read the information from a file into a list and then display the list to the screen. Remove the fifth item in the list and display the list again. Ask the program user for an entry into the list and add it to the list. Display the list one last time.

CODE:

Use the provided files (L5listSrc.zip) and the disneyin.txt file.
Note the data in the file disneyin.txt : You must create a struct called Disney. This struct will hold a single disney/warner brothers character (both name and id). This will be declared in the driver.
Thus to instantiate the list, say l, you will code

```
List<Disney> l
```

(l is a list of Disney)

Add overloaded insertion and extraction operators to the Disney struct.
These must be used.

Your program is to have the files : lab5_client_driver.cpp, list.h , list.t , list.cpp
The driver is to demonstrate that the above mentioned operations are performed.
Do not hard code the file name; get file name from user.

DELIVERABLES:

lab5_client_driver.cpp, with the output from console window pasted at the end of the driver source code.

Due Date : 10 March 2026
